

# Do while loop

---

```
#include<stdio.h>
#include<stdlib.h>

int main(){
    int index = 1;
    do {
        printf("%d\n", index);
        index++ ;
    }
    while(index <= 5);

return 0;
}
```

Do While loops, are very similar to basic while loops, except, in Do while loops, the code is executed first in the `do`, function, then it checks whether the condition is met or not in the `while`, function.
